Week 4 Check-In

- Increased soldering heat from 650 to 750: cut down soldering time significantly and improved quality
- All motors resoldered with higher qualoty and tested with smoke stopper for short circuits
- Soldered receiver antenna using new heat knowledge; much smaller pads required more precision
- Paired RadioMaster to receiver through ExpressLRS WiFi connection
- Assigned joystick to motor spin (props off) to ensure everything was paired correctly
- Decided not to test drone after research; new flier often crash; thus paired RadioMaster to online simulator and practicing there
- Assigned each control aspect (pitch, yaw, roll, motor speed, arm, disarm, flight mode) to proper controls after learning the different between flight modes and spring loaded vs. regular joysticks
- Gaining proficiency with different flight modes and stably flying
- Configured rotation of motors in proper directions, while syncing to RadioMaster controller
- Learned about important safety features that inhibit motor testing while Bluetooth is connected
